

CASE STUDY · INDUSTRY BRIEF

Retail & E-commerce

Supply Chain Intelligence

How AI-powered supply chain intelligence eliminates stockouts, unlocks dead stock capital, and gives retail operations complete real-time visibility across every channel and warehouse.

Industry: Retail & E-commerce · Version 1.0 · March 2026

1. Executive Summary

Retail and e-commerce operations face a paradox that compounds with scale: the more SKUs you carry, the more channels you sell through, and the more warehouses you operate - the harder it becomes to know what you actually have, what you actually need, and what is quietly costing you money by sitting untouched in a warehouse.

Stockouts cost retailers up to 7.4% of annual revenue. Overstock locks capital in inventory that will be marked down or written off. Multi-channel operations go out of sync. Seasonal peaks arrive faster than procurement can respond. These challenges affect retail operations across every scale and structure - from growing direct-to-consumer brands to established multi-channel retailers.

This document presents a detailed analysis of the retail supply chain landscape - the specific pain points, their financial impact, and exactly how our AI-powered platform solves each one. We connect to your existing e-commerce platform, ERP, WMS, and marketplace accounts. We do not require migration. We do not store your data externally. We learn from your historical data and deliver actionable intelligence.

Key Outcomes - Retail Deployments

2. The Retail Supply Chain Landscape (2025–2026)

2.1 Market Size and AI Adoption Momentum

The retail segment is the fastest-growing vertical in AI supply chain adoption - posting a CAGR of 47.8%, the highest of any industry (Meticulous Research, 2024). In 2025, 83% of retail and e-commerce companies have implemented some form of AI in their supply chain operations, up from 68% in 2023.

This rapid adoption is driven by the acute financial consequences of getting supply chain right or wrong in retail. Every stockout event is a direct transfer of revenue to a competitor. Every week of overstock is capital that is not working.

47.8% Retail AI SC CAGR Meticulous Research 2024	83% Retail AI adoption 2025 AllAboutAI 2025	7.4% Revenue lost to stockouts NielsenIQ via Nexdriver	69% Stockout → buy competitor HBR via Anchor Group 2026
---	--	---	--

2.2 The True Cost of Inventory Distortion

Inventory distortion - the combined financial damage of stockouts, overstock, and shrinkage - costs the global economy \$1.6 trillion annually (Meteor Space, January 2025). For retail specifically, this manifests in three simultaneous failures:

- Stockouts during demand peaks: Products customers want are unavailable, generating zero revenue while the customer completes the purchase from a competitor - often permanently switching loyalty.
- Overstock of slow-moving SKUs: Products accumulate in warehouses, consuming space and working capital, ultimately requiring markdown or write-off decisions that directly erode gross margin.
- Multi-channel desynchronisation: The same SKU shows different stock levels across your website, app, marketplace listings, and physical stores - leading to overselling, failed orders, and manual reconciliation overhead.

3. Retail Supply Chain Pain Points

Figure 1: Five critical pain points in retail & e-commerce supply chains with financial impact indicators

3.1 Stockouts During Demand Spikes

The most visible and immediately costly failure in retail supply chains. Stockouts during peak demand - seasonal events, promotions, viral product moments - represent a window of lost revenue that cannot be recovered. The sale is lost the moment the customer sees 'Out of Stock' and navigates to a competitor.

The data: 69% of customers who encounter a stockout purchase from a competitor rather than waiting for restock (HBR via Anchor Group, 2026). For repeat-purchase products, a single stockout can permanently shift a customer's buying habit.

Our demand forecasting models are trained on your specific SKU sales history, promotional calendars, and seasonal patterns - generating per-SKU demand forecasts that flag upcoming spikes weeks before they arrive, giving procurement time to act.

3.2 Overstock and Dead Stock Accumulation

Overstock is the quiet counterpart to stockouts. Products ordered in excess accumulate in warehouses, consuming space and working capital that could be deployed in higher-performing SKUs or growth initiatives.

Dead stock - products with zero or near-zero movement - compounds this further. Without a systematic detection mechanism, dead stock can accumulate for months before anyone in the organisation quantifies its financial impact. By then, the write-off or deep markdown decision is the only option.

Data point: The average retail business holds 38% excess inventory relative to optimised levels (Netstock via Anchor Group, 2026). Reducing this to 20% or below frees significant working capital while improving warehouse utilisation.

3.3 Multi-Channel Inventory Chaos

Retailers selling across multiple channels face a synchronisation challenge that grows with every channel added. Without a unified inventory layer, each channel maintains its own stock allocation. When a product sells faster on one channel, others continue showing it as available - leading to overselling, failed orders, and customer complaints. Manual reconciliation becomes unmanageable as SKU count and channel count grow.

4. Our Solution - AI Retail Supply Chain Intelligence

Our platform is an intelligence layer that connects to your existing retail stack - your e-commerce platform, ERP, WMS, and marketplace accounts - and surfaces AI-powered insights, forecasts, alerts, and recommendations through a unified Command Center dashboard and an AI assistant trained exclusively on your data.

Figure 2: Platform architecture - connecting to your existing retail systems, adding AI intelligence on top

4.1 Pain Point to Solution - Direct Mapping

⚠ Pain Point	✓ Our Solution
Stockouts during demand peaks cost up to 7.4% of annual revenue	Per-SKU AI demand forecasting flags upcoming spikes 3–6 weeks ahead - time to procure before shortage occurs
Overstock ties up working capital, requires markdown or write-off	Dead stock detection with exact capital-locked values and markdown/transfer recommendations before write-offs compound
Multi-channel inventory goes out of sync, leading to overselling	Real-time unified inventory view across all channels with oversell prevention and automatic channel rebalancing
Seasonal peaks consistently under- or over-prepared for	Seasonal analysis module with pre-season procurement targets per product category
Dead stock accumulates silently - no one is tracking it	AI flags every zero-movement SKU daily, quantifies capital impact, and surfaces action options
Manual stock reconciliation consumes significant team time	Automated sync, alerts, and AI summaries - 65–80% reduction in manual inventory operations time

4.2 Core Modules for Retail & E-commerce

AI Demand Forecasting & Inventory Planning

Machine learning models trained on your specific SKU sales history, seasonal patterns, promotional calendars, and market signals. The system generates per-SKU demand forecasts that translate directly into procurement quantity recommendations.

Figure 3: AI demand forecasting flow - from raw sales data to procurement-ready SKU quantity plans

- **Coverage:** SKU-level demand prediction - product-specific forecasts, not category-level averages
- Seasonal trend detection - automatically identifies and plans for cyclical demand patterns
- Promotional lift modelling - factor upcoming campaigns into stock planning
- Procurement quantity recommendations with confidence intervals and supplier lead times factored in

Multi-Channel Inventory Sync

A unified real-time inventory layer sits above all your sales channels. When stock changes on any channel, all channels update simultaneously. Channel priority rules determine allocation logic during shortage - ensuring your highest-margin channel is always prioritised.

Figure 4: Multi-channel inventory sync - single source of truth across every channel and warehouse

- Real-time stock sync across all channels - website, app, marketplaces, physical stores
- Oversell prevention - channels automatically closed when stock drops below threshold
- Channel priority rules - you define which channels get first allocation during low stock
- Inter-warehouse transfer recommendations when imbalance detected across locations

Dead Stock & Overstock Detection

Every SKU is continuously monitored for movement velocity. Products with declining or zero movement are flagged as overstock or dead stock candidates, with an exact capital-locked value calculated. The AI surfaces markdown recommendations, transfer suggestions, or bundle opportunity flags before the situation requires a write-off decision.

- Dead stock flagging: SKUs with zero movement over 30, 60, or 90 days (configurable threshold)
- Capital locked calculation: exact value of capital tied up in each flagged SKU
- Overstock alerts: automatic notification when inventory coverage exceeds demand forecast threshold
- Markdown and liquidation recommendations with estimated margin recovery projections

AI Assistant - Ask Your Inventory Anything

An AI chatbot trained exclusively on your inventory, order, and sales data. Your operations team can ask natural language questions and receive direct answers from your live data - no dashboards to navigate, no fixed reports to wait for.

Example Question	AI Response
"Which SKUs are likely to stock out in the next 2 weeks?"	3 SKUs flagged: SKU-2041 (4% cover), SKU-1890 (6% cover), SKU-3312 (8% cover). Recommend reorder by Thursday.
"How much capital is locked in dead stock this month?"	INR 4.3L across 8 SKUs with zero movement 60+ days. Highest: SKU-0887 (INR 1.8L). Markdown plan available.
"What is our fill rate for the top 50 SKUs this quarter?"	Top-50 fill rate: 91.2%. 4 SKUs below 80% threshold. Up from 88.4% last quarter.

Every response cites the underlying data source. No black box - your team sees the reasoning behind every insight.

5. Data Privacy and Integration

5.1 How We Connect

We support direct integration with all major retail and e-commerce platforms:

Platform Type	Supported Systems	Integration Method
E-commerce Platform	Shopify, WooCommerce, Magento, custom storefronts	API connector - real-time sync
ERP / Back-office	SAP, Oracle, NetSuite, Tally, custom ERP	API or direct DB connector
Marketplace	Amazon, Flipkart, Meesho, Myntra	Marketplace API
WMS	HighJump, Manhattan, custom WMS	API or DB connector
Database	PostgreSQL, MySQL, MongoDB, SQL Server	Direct read-only connection

Flat files	CSV, Excel exports from any legacy system	Scheduled import
------------	---	------------------

5.2 Your Data, Your Control

Retail data - pricing strategies, supplier relationships, sales velocity by SKU, and customer purchase patterns - is commercially sensitive. Our data handling follows four non-negotiable principles:

- **Data residency:** Your data stays on your servers. The platform is deployed on your infrastructure - cloud or on-premise. No data is transmitted to or stored on our servers.
- **Access model:** Read-only access by default. We read your data to generate intelligence. We never write to or modify your production systems.
- **Isolation:** No cross-client data sharing. Your data trains AI models that serve only you - never used to inform any other organisation's models.
- **Transparency:** Full audit trail. Every data access, AI recommendation, and user action is logged with timestamps. You can see exactly what the system accessed and when.

6. Expected Outcomes

The following outcomes are based on documented results from comparable AI supply chain deployments in retail and e-commerce. Results will vary based on baseline operations, data quality, and adoption depth.

Metric	Baseline	With Our Solution	Source
Stockout incidents	11–16% of SKUs monthly	↓28% within 90 days	ToolsGroup Dec 2025
Inventory accuracy	~66–83% average	↑92–97% post-deployment	Meteor Space 2025
Dead stock capital	38% excess inventory avg	↓to 20% or below	Netstock / Anchor 2026
Order fill rate	72–80% average	↑22% improvement	StartUs Insights 2025
Sell-through rate	Varies by category	↑15% improvement	RetailTouchPoints 2023
Manual ops time	100% manual reconciliation	↓65–80% reduction	Accenture 2025
18-month ROI	87% (traditional approach)	307% with our AI layer	AllAboutAI 2025

Figure 5: ROI trajectory - AI supply chain platform vs. traditional approach over 24 months (retail deployments)

The ROI curve for retail deployments typically shows a steep inflection around month 4–6, when the demand forecasting models have sufficient data to accurately predict peak demand events. The first seasonal peak navigated with AI-driven procurement typically generates the most visible and immediate ROI.

7. Real-World Results - Case Snapshots

Case	Challenge	Solution Applied	Result
Multi-brand retail distributor	Seasonal overstock causing INR 3M+ in write-offs annually. 3 warehouses, no unified view.	Dead stock detection + seasonal planning + multi-warehouse sync	INR 3M inventory recovered in 6 months. 85% less manual reporting time.
D2C apparel brand	Stockouts during peak season - missed INR 1.2Cr in revenue. Fully manual procurement.	Demand forecasting + procurement recommendations + overstock alerts	99.1% in-stock rate through peak season. First time in 4 years.
FMCG multi-channel distributor	Inventory out of sync across 4 channels. Weekly overselling incidents and customer complaints.	Multi-channel sync + channel priority rules + AI assistant queries	Zero overselling incidents in 90 days. Fill rate +22%.

8. Why We Are Different

What	Traditional Approach	With Our Platform
Replace existing systems?	Usually required	Never - we connect to what you have
Per-SKU demand forecasting	Category-level or manual	ML per SKU, trained on your data
Multi-channel sync	Manual reconciliation	Real-time unified sync across all channels
Dead stock detection	Manual reports, monthly	AI-flagged daily with capital impact value
AI chatbot on live data	Not available	Natural language queries on your live inventory
Data stays on your servers	Varies - often SaaS cloud	Always - zero external data transmission
Seasonal planning	Historical averages, manual	AI seasonal model per product category
Time to go-live	3–12 months typical	Under 5 working days standard
ROI timeline	12–18 months typical	Positive ROI typically within 6 months

9. Implementation - From Sign-Off to Go-Live

We target go-live within 5 working days for standard retail configurations. Multi-site deployments with custom ERP integrations typically run 2–3 weeks. Every implementation follows the same structured path:

Step	Timeline	What We Do	Your Involvement
1 - Discovery	Day 0	Understand your channels, SKU count, warehouses, and top pain points	1 hour with ops lead
2 - Analysis	Week 1	Map supply chain flows, seasonal patterns, data sources, integration requirements	2–3 hours with your team
3 - Configure	Week 2	Connect to your platforms, configure modules to your specific workflows	IT access for 4–6 hours
4 - Deploy	Week 3	Install on your infrastructure, staff training walkthrough, go-live sign-off	2-hour team session
5 - Optimise	Ongoing	AI models improve with each sales cycle; monthly review sessions	30-min monthly check-in

10. Next Steps

The most effective way to understand the platform's impact on your retail operations is a 30-minute live demonstration on a read-only snapshot of your own data. We connect to your ERP or inventory database, run our models, and show you - within the demo - what your supply chain looks like through our platform's lens.

What a Discovery Call Covers

- Your current channel structure, SKU count, warehouse footprint, and integration points
- Your top 3 supply chain pain points and their estimated monthly financial impact
- Which specific modules are most relevant to your operations
- A clear go-live timeline and integration compatibility check for your existing systems
