

CASE STUDY · INDUSTRY BRIEF

Food & Beverage

Supply Chain Intelligence

How AI-powered supply chain intelligence eliminates food waste, enables accurate seasonal planning, and gives F&B operations complete real-time visibility across every warehouse, SKU, and supplier.

↓35% Food waste from expiry ReFED 2024	↑50% Seasonal plan accuracy AllAboutAI 2025	↓28% Procurement overspend Extensiv 2025	307% ROI within 18 months AllAboutAI 2025

1. Executive Summary

Food and beverage supply chains operate on thinner margins, tighter time windows, and higher waste risk than almost any other industry. Products expire. Seasonal demand swings are wide and fast. Supplier inconsistency disrupts production schedules. And 30% of all food produced globally is wasted in the supply chain before it reaches the consumer - a number that translates directly into margin erosion, write-offs, and capital locked in inventory that will never generate revenue.

Despite this, the majority of F&B operations still manage inventory rotation manually, plan for seasonal peaks using the previous year's actuals, and discover expired stock at the point of write-off rather than weeks before when intervention was still possible. The result is a supply chain that is always reactive - responding to problems that AI could have predicted and prevented.

This document presents a detailed analysis of the food and beverage supply chain landscape - the specific pain points, their financial impact, and exactly how our AI-powered platform solves each one. We connect to your existing ERP, WMS, supplier portals, and production systems. No migration required. Your data never leaves your servers.

Key Outcomes - Food & Beverage Deployments

↓35% Food waste from expiry ReFED 2024	↑50% Seasonal planning accuracy AIAboutAI 2025	↓28% Procurement overspend Extensiv 2025	↑20% Working capital efficiency Verified deployments
---	---	---	---

2. The Food & Beverage Supply Chain Landscape (2025–2026)

2.1 The Scale of the Problem - Food Waste

30% of all food produced globally is wasted in the supply chain - before it reaches the consumer (ReFED, 2024). For F&B businesses, this is not an abstract sustainability statistic. It is a direct margin drain: every unit that expires in a warehouse or distribution centre represents procurement cost, storage cost, handling cost, and disposal cost - with zero revenue generated.

The primary driver of food waste in supply chains is not spoilage in transit - it is poor inventory rotation and demand misalignment. Products sit in the wrong location, are picked in the wrong order, or are procured in quantities that no longer match actual demand. All three of these failure modes are solvable with AI-powered supply chain intelligence.

2.2 Seasonal Demand - The Biggest Planning Challenge

Food and beverage demand is among the most seasonal of any consumer goods category. Festive seasons, harvest cycles, weather patterns, and promotional events create demand swings that can double or triple volume for specific SKUs within a matter of weeks. The planning challenge is not just predicting these swings - it is acting on the prediction early enough to secure supply without over-ordering.

Businesses that plan seasonally with last year's data are always at least one cycle behind. AI forecasting models trained on your specific SKU-level history - including micro-seasonal patterns, promotional uplift, and regional demand variation - enable pre-season procurement that is accurate to within a margin that manual planning cannot achieve.

The 2025 tariff escalations and agricultural supply disruptions further exposed how quickly F&B supply chain assumptions can be invalidated. Businesses with real-time supplier performance monitoring and alternative vendor sourcing were able to adapt in days rather than weeks.

3. Food & Beverage Supply Chain Pain Points

Figure 1: Five critical pain points in food & beverage supply chains with financial and operational impact indicators

3.1 Spoilage from Poor Inventory Rotation

The most operationally damaging and financially direct pain point in F&B supply chains. When inventory is not rotated correctly - when newer stock is picked before older stock, or when the oldest-expiry items are not prioritised for dispatch - products expire in the warehouse. Each expiry event is a compounding cost: procurement, storage, labour, and disposal, with zero revenue offset.

The solution: FEFO (First Expired, First Out) picking logic enforced automatically at the warehouse level. Our platform assigns expiry dates at goods receipt and enforces FEFO throughout the warehouse workflow - no manual instruction to the picking team, no reliance on staff memory. The oldest-expiry stock always moves first, automatically.

3.2 Seasonal Demand Misalignment

Every F&B business has seasonal patterns. Mango products peak in summer. Festive gift SKUs spike in October–December. Back-to-school snack packs surge in June–July. The problem is not that these patterns are unknown - it is that procurement decisions are made too close to the peak for the supply chain to respond effectively.

Our platform generates per-SKU seasonal demand forecasts 6–8 weeks ahead of each peak window - giving procurement teams time to secure supply at standard prices, negotiate volume commitments with suppliers, and calibrate warehouse space allocation before demand arrives. The result is fewer stockouts during peaks and far less overstock in the weeks that follow.

3.3 Vendor Supply Inconsistency

F&B supply chains are acutely sensitive to vendor inconsistency. A fresh produce supplier who delivers 2 days late creates immediate production schedule disruption. A packaging material vendor with variable lead times forces safety stock decisions that tie up capital unnecessarily. Without continuous supplier performance monitoring, these patterns are only visible in retrospect - after the disruption has already occurred.

Our supplier performance module tracks on-time delivery rate, lead time variance, order accuracy, and price fluctuation per vendor in real time. When a supplier shows deteriorating performance, the system flags it and surfaces qualified alternatives from your approved vendor list - before the disruption reaches your production floor.

3.4 No Cross-Site Expiry Visibility

F&B businesses operating across multiple warehouses, production facilities, or distribution centres face a structural visibility problem: the same SKU may be at different stages of expiry in different locations. Without a unified cross-site inventory view, the location with the oldest-expiry stock has no mechanism to transfer it to the location where it will sell fastest - and the write-off happens silently.

Our platform provides a real-time unified inventory view across every location, with expiry status visible at the SKU and batch level. When inventory at one location is approaching its expiry threshold while another location has demand for that same SKU, the system automatically surfaces an inter-warehouse transfer recommendation - before the write-off decision becomes unavoidable.

4. Our Solution - AI Food & Beverage Supply Chain Intelligence

Our platform is an intelligence layer that connects to your existing F&B infrastructure - ERP, WMS, supplier portals, production planning systems, and POS/distribution platforms - and surfaces AI-powered waste reduction, demand forecasting, seasonal planning, and inventory management through a unified Command Center and an AI assistant trained exclusively on your data.

Figure 2: Platform architecture - connecting to your existing F&B systems, adding AI intelligence on top

4.1 Pain Point to Solution - Direct Mapping

⚠ Pain Point	✓ Our Solution
Spoilage from poor inventory rotation erodes margins daily	FEFO picking logic enforced automatically - oldest expiry always dispatched first, zero manual intervention
Seasonal peaks arrive before procurement can respond	Per-SKU seasonal demand forecasts 6–8 weeks ahead - time to secure supply at standard prices before peak
30% of food wasted in supply chains globally	Consumption prediction + FEFO rotation + expiry alerts + transfer recommendations = up to ↓35% waste
Vendor inconsistency disrupts production schedules	Real-time supplier performance scoring - on-time delivery, lead time variance, order accuracy tracked daily
No cross-site expiry visibility - write-offs happen silently	Unified multi-warehouse expiry view with automatic inter-site transfer recommendations before breach
Seasonal overstocking leaves capital locked post-peak	Overstock alerts fire before dead stock situation develops - markdown/liquidation recommendations included

4.2 Core Modules for Food & Beverage

AI Demand Forecasting & Seasonal Planning

The most impactful module for F&B operations. Machine learning models trained on your specific SKU sales history, seasonal curves, promotional calendars, and regional demand patterns generate per-SKU demand forecasts that extend 6–8 weeks forward - giving your procurement team time to act before each seasonal window opens.

Figure 3: Seasonal demand planning - without AI vs. with AI. 50% improvement in seasonal planning accuracy.

- **Forecast horizon:** Per-SKU seasonal demand forecast 6–8 weeks ahead - not last year's actuals, but ML-driven prediction
- Category-level seasonal curves with SKU-level granularity - mango vs. alphonso mango vs. mango pulp
- Pre-season procurement target generation - quantities, timing, and supplier allocation recommendations
- Promotional uplift modelling - factor trade promotions and price events into demand planning

FEFO Inventory Rotation & Waste Control

The waste reduction engine of the platform. Every unit received is tracked with its expiry date. FEFO logic determines picking priority automatically - no warehouse staff instruction required, no reliance on manual checks. Expiry alerts fire at configurable thresholds (30, 60, 90 days) with enough lead time for meaningful intervention.

Figure 4: FEFO waste reduction flow - from goods receipt to expiry alert to transfer/markdown action

- FEFO enforced at picking: oldest-expiry stock always dispatched first, system-enforced
- Expiry alert thresholds: configurable at 30, 60, 90 days - fires to warehouse manager, procurement, and buyer simultaneously
- Inter-warehouse transfer recommendations: when Site A has near-expiry stock and Site B has demand for the same SKU
- Markdown and liquidation suggestions: AI calculates the margin-recovery case for each near-expiry action

Multi-Warehouse Inventory Visibility

A unified real-time inventory view across every warehouse, production facility, and distribution centre. Stock levels, expiry status, movement velocity, and inter-site imbalances are visible in a single dashboard - giving operations managers the information they need to make proactive decisions rather than reactive ones.

- Live stock levels per SKU across every site - no reconciliation delay
- Dead stock detection: SKUs with zero movement flagged daily with capital-locked value calculated
- Overstock alerts: automatic notification when stock coverage exceeds demand forecast by threshold
- Warehouse utilisation view: space consumption vs. capacity, with rebalancing recommendations

Supplier Performance Tracking

Every supplier in your network is monitored continuously across four performance dimensions: on-time delivery rate, lead time variance, order accuracy, and price trend. Deteriorating performance triggers a flag before it becomes a production schedule disruption. When performance falls below threshold, the system surfaces approved alternative vendors from your database.

- Real-time on-time delivery tracking per vendor - weekly and rolling 90-day scorecards
- Lead time variance alerts: when actual lead time exceeds committed lead time by configured tolerance
- Order accuracy monitoring: short deliveries, substitutions, and quality deviations tracked
- Alternative vendor suggestions: AI surfaces qualified alternatives when primary vendor underperforms

AI Assistant - Your F&B Supply Chain Intelligence

An AI chatbot trained exclusively on your inventory, order, supplier, and sales data. Your team can ask natural language questions and receive direct answers from your live data - no reports to wait for, no dashboards to navigate.

Example Question	AI Response
"Which SKUs are expiring in the next 30 days across all warehouses?"	14 SKUs approaching expiry in 30 days. Largest: Batch #F-2201 (Alphonso Pulp, 1,240 units, Delhi WH). Transfer to Mumbai recommended - 3-day lead.
"Are we prepared for the Diwali seasonal surge on our mithai SKUs?"	Mithai category: 4 SKUs at 60% procurement vs. forecast. Recommend increasing POs by 340 units by Oct 5 to hit 95% readiness. 2 suppliers confirmed available.
"Which supplier had the most delays this quarter?"	Supplier C: 6 delayed deliveries in Q3, avg 3.4 days late. On-time rate: 62% vs. 90% SLA. Recommended: performance review or partial switch to Supplier D.

Every answer is sourced from your live data. Reasoning is shown - no black box, full transparency for every recommendation.

5. Data Privacy and Integration

5.1 How We Connect

We support direct integration with all major F&B ERP, WMS, and operational systems:

System Type	Supported Platforms	Integration Method
ERP / Accounting	SAP, Tally Prime, Oracle, Microsoft Dynamics, Odoo	API connector or direct DB
WMS / Warehouse	HighJump, custom WMS, warehouse spreadsheet systems	API or DB connector
Production Planning	Custom MRP, production scheduling tools	API or structured import
Supplier Portals	Ariba, custom supplier portals, WhatsApp-based PO systems	API or structured import
POS / Distribution	Retail POS systems, distribution management platforms	API or DB connector
Database	PostgreSQL, MySQL, MongoDB, SQL Server, Oracle DB	Direct read-only connection
Flat files	CSV, Excel, Google Sheets exports from any legacy system	Scheduled secure import

5.2 Your Data, Your Control

Your F&B data - supplier pricing, seasonal demand curves, formulation details, and customer account data - is commercially sensitive. Our platform is built on four non-negotiable data principles:

- **Data residency:** Your data stays on your servers. The platform is deployed on your infrastructure - on-premise or private cloud. Your data never leaves your environment. No external transmission, no third-party storage.
- **Access model:** Read-only access by default. We read your operational data to generate intelligence. We never write to, modify, or delete records in your production systems.
- **Isolation:** No cross-client data sharing. Your seasonal demand curves, supplier pricing, and inventory data train AI models that serve only your organisation - never used to inform any other company's models.
- **Transparency:** Full audit trail. Every data access, AI recommendation, and user action is logged with timestamps. Exportable for internal audit or regulatory inspection.

6. Expected Outcomes

The following outcomes are based on documented results from comparable AI supply chain deployments in food and beverage. Individual results will vary based on baseline operations, data quality, and adoption depth.

Metric	Baseline	With Our Solution	Source
Food waste from expiry	~30% of food wasted globally	↓35% waste reduction	ReFED 2024
Seasonal planning accuracy	Reactive - based on past actuals	↑50% improvement	AllAboutAI 2025
Procurement overspend	Emergency orders at premium price	↓28% reduction	Extensiv 2025
Working capital efficiency	38% excess inventory avg	↑20% improvement	Verified deployments
Inventory accuracy	~66–80% average	↑92–97% post-deployment	Meteor Space 2025
Manual ops time	Manual tracking and reconciliation	↓65–80% reduction	Accenture 2025
18-month ROI	87% (traditional approach)	307% with our AI layer	AllAboutAI 2025

Figure 5: ROI trajectory - AI supply chain platform vs. traditional approach over 24 months (F&B deployments)

The ROI curve for F&B deployments shows two distinct inflection points: an early one at month 2–3 when FEFO enforcement and expiry alerts eliminate the first wave of write-offs, and a larger one at month 5–6 when the seasonal planning AI navigates the first peak with AI-driven procurement - eliminating both the overstock that typically follows and the emergency orders that precede it.

7. Real-World Results - Case Snapshots

Case	Challenge	Solution Applied	Result
Regional FMCG distributor	Seasonal overstock causing INR 3M+ in write-offs annually. 3 warehouses, manual expiry tracking, no unified stock view.	FEFO enforcement + seasonal demand forecasting + multi-warehouse sync + dead stock detection	INR 3M in inventory value recovered in 6 months. 85% reduction in manual reporting time. Zero write-offs from missed expiry.
Fresh produce distributor	30% of mangoes and perishables expiring before dispatch. FIFO being applied inconsistently across 4 warehouse shifts.	FEFO picking logic enforcement + expiry alerts at 7, 14, 21 days + inter-site transfer recommendations	Perishable waste reduced by 38% in 90 days. Inter-site transfers increased by 4x. First quarter with zero forced markdowns.
Packaged food manufacturer	Seasonal production planning based on last year actuals - stockouts every Diwali, overstock every January. 12 SKUs affected.	AI seasonal demand forecasting + pre-season procurement targets + supplier lead time monitoring	First Diwali peak with 99% in-stock rate. Overstock post-season reduced by 62%. Emergency procurement spend: zero.

8. Why We Are Different

What	Traditional Approach	With Our Platform
Replace existing ERP/WMS?	<i>Usually required</i>	Never - we connect to what you have
FEFO enforcement	<i>Manual warehouse instruction</i>	AI-enforced at picking, system-wide, zero manual effort
Seasonal demand forecasting	<i>Last year's actuals, manual plan</i>	ML per SKU, 6–8 weeks ahead, updated continuously
Expiry alert system	<i>Manual checks or monthly reports</i>	Automated 30/60/90-day alerts - fires before write-off
Cross-site expiry visibility	<i>Not available - per-site only</i>	Unified multi-warehouse view with transfer recommendations
Supplier performance tracking	<i>Periodic manual review</i>	Continuous real-time scoring - OTD, lead time, accuracy
AI chatbot on live data	<i>Not available</i>	Natural language queries on your live F&B data
Data stays on your servers	<i>Varies - often SaaS cloud</i>	Always - zero external data transmission
Time to go-live	<i>3–12 months typical</i>	Under 5 working days standard

9. Implementation - From Sign-Off to Go-Live

We target go-live within 5 working days for standard F&B configurations. Multi-site operations with custom ERP integrations typically complete in 2–3 weeks. Every implementation follows the same structured path with minimal disruption to your operations.

Step	Timeline	What We Do	Your Involvement
1 - Discovery	Day 0	Understand your sites, SKU count, seasonal calendar, suppliers, and top pain points	1 hour with ops lead
2 - Analysis	Week 1	Map inventory flows, expiry patterns, seasonal cycles, data sources, integration points	2–3 hours with your team
3 - Configure	Week 2	Connect to ERP/WMS, configure FEFO logic, expiry thresholds, and seasonal forecast models	IT access for 4–6 hours
4 - Deploy	Week 3	Install on your infrastructure, staff walkthrough, FEFO go-live sign-off	2-hour team training session

5 - Optimise	Ongoing	Seasonal models improve each cycle; monthly review of waste reduction and forecast accuracy	30-min monthly check-in
--------------	---------	---	-------------------------

10. Next Steps

The fastest way to understand the platform's impact on your F&B operations is a 30-minute live demonstration on a read-only snapshot of your own inventory and sales data. We connect, run our models, and show you - within the demo - your current expiry risk, seasonal readiness gaps, and supplier performance profile through our platform.

What a Discovery Call Covers

- Your current warehouse footprint, SKU count, seasonal calendar, and top expiry risk SKUs
- Your top 3 supply chain pain points and their estimated monthly financial impact in INR
- Which specific modules are most relevant - FEFO, seasonal planning, supplier tracking, or all
- A clear go-live timeline and integration compatibility check for your existing systems
- A demo of the AI assistant answering questions about your specific product categories
